

IN THE CLAIMS

Please amend the claims as follows:

1. (original) A transmission system (1) comprising a transmitter (2), at least one receiver (4) and a data network (3) coupling the transmitter (2) and the receiver (4), whereby the at least one receiver (4) comprises a dejitter mechanism (31), the transmitter (2) comprising jitter means (30) for introducing jitter into data on the network (3), the dejitter mechanism (31) being provided with a jitter control input (32) for controlling an extent of dejitter.
2. (original) The transmission system (1) according to claim 1, characterised in that the jitter means (30) are arranged for a stepwise control of the introduced jitter.
3. (original) The transmission system (1) according to claim 1, characterised in that the dejitter mechanism (31) is arranged for a stepwise control of the extent of dejitter.
4. (original) The transmission system (1) according to claim 1, characterised in that the data network (3) is a network having a fixed or a non fixed delay.

5. (original) The transmission system (1) according to claim 1, characterised in that the transmission system (1) is a pay per view system.

6. (currently amended) A transmitter (2) for use in the transmission system (1) according to ~~any one of the claims 1-5~~claim 1.

7. (currently amended) A receiver (4) for use in the transmission system (1) according to ~~any one of the claims 1-5~~claim 1.

8. (original) A method of reception of data comprising jitter, whereby after receipt of the data the jitter is removed, wherein upon transmission the jitter is deliberately added to the data.

9. (original) A method of transmission of data, whereby after receipt of the data the jitter is removed, wherein upon transmission the jitter is deliberately added to the data.

10. (currently amended) The method according to claim 8 ~~or claim 9~~, characterised in that the extent of deliberately added jitter is included as jitter control information in the transmitted data.
